

Web Scrapping Using Python

Name: K. Nithya Rathod

Roll No: _____

Introduction

Web scraping is the process of extracting data from websites automatically. It helps collect large amounts of information quickly and efficiently.

Need for Web Scraping

- Data collection for research
- Price comparison
- Market analysis
- News aggregation
- Job listing collection

How Web Scraping Works

1. Send a request to a website.
2. Download webpage content.
3. Parse HTML.
4. Extract data.
5. Store data.

Tools and Libraries

Python, BeautifulSoup, Requests, Selenium, Pandas

Advantages

Saves time and effort, Automates data collection, Provides real-time information, Supports data analysis

Limitations

Website blocking, Dynamic content challenges, Legal considerations, Website changes may break scripts

Sample Python Code

```
import requests
from bs4 import BeautifulSoup

response = requests.get('https://example.com')
```

Applications

E-commerce, Finance, Education, Healthcare, Social Media Analytics

Conclusion

Web scraping is a powerful technique for collecting online data. Python provides simple and effective libraries for scraping.
